

The menu bar is normally located at the top of the FlingIt screen. The button will open existing web pages. The 5% shows your percent location on the current page. The button will open existing bookmarks or create a new bookmark. The will start the find feature on the page. Lastly, the acts like a normal web browser with back, home, and forward buttons.

When you tap on a picture that is larger than the viewable area it will open the picture in a new screen. In this screen you can move the picture around to view it in its entirety. When you are done press either the up or down arrow buttons on the handheld to return to regular web page.

When you download a new web page you are given the option of the depth of links you wish to download. When you tap on a link that you have not downloaded, FlingIt will tell give you an error message. This will tell you the URL of the page you tried to download.

Using FlingIt with USB

FlingIt can be used via USB, however, you will be required to sync your Palm in order to complete the process. Unlike the FlingIt process via a serial port, you do not need to run the FlingIt program simultaneously on the Palm while downloading a site.

After finding a site to fling to your Palm, click the FlingIt button on your web browser toolbar.

Next, you will need to change the COM setting.

First, click on Options>Advanced>Change COMx Setting
